PROBLEM 1. Study all subsets of some set with operations symmetric difference and intersection. Is it a ring? If it is, then is it commutative? Does it include identity element? Which elements are reversible, zero divisor, idempotent?

Solution:

Assume that set S is an arbitrary non-empty set. And let:

$$\mathcal{M}(A) := \{D \mid D \subseteq A\}$$

First of all, we will verify some operations of symmetric difference.

Definition of symmetric difference:

$$R \triangle S := \{x \mid (x \in R \& x \notin S) \vee (x \in S \& x \notin R)\}$$

$$1. R \triangle S = S \triangle R$$

$$\begin{aligned} R \triangle S &= \{x \mid (x \in R \& x \notin S) \vee (x \in S \& x \notin R)\} \\ &= \{x \mid (x \in S \& x \notin R) \vee (x \in R \& x \notin S)\} \\ &= S \triangle R \end{aligned}$$

$$2. (R \triangle S) \triangle T = R \triangle (S \triangle T)$$

$$\begin{aligned}
(R \triangle S) \triangle T &= \{x | (x \in R \& x \notin S) \vee (x \in S \& x \notin R)\} \triangle T \\
&= \{x | ((x \in R \& x \notin S) \vee (x \in S \& x \notin R)) \& x \notin T \\
&\quad \vee x \in T \& (\neg((x \in R \& x \notin S) \vee (x \in S \& x \notin R)))\} \\
&= \{x | (x \in R \& x \notin S \& x \notin T) \vee (x \in S \& x \notin R \& x \notin T) \\
&\quad \vee (x \in T \& (x \notin R \vee x \in S) \& (x \notin S \vee x \in R))\} \\
&= \{x | (x \in R \& x \notin S \& x \notin T) \vee (x \in S \& x \notin R \& x \notin T) \\
&\quad \vee (x \in T \& x \notin R \& x \notin S) \vee (x \in T \& x \in R \& x \in S)\} \\
&= \{x | (x \in R \& x \notin S \& x \notin T) \vee (x \notin R \& x \in S \& x \notin T) \\
&\quad \vee (x \notin R \& x \notin S \& x \in T) \vee (x \in R \& x \in S \& x \in T)\} \\
&= \{x | (x \in T \& x \notin S \& x \notin R) \vee (x \notin T \& x \in S \& x \notin R) \\
&\quad \vee (x \notin T \& x \notin S \& x \in R) \vee (x \in T \& x \in S \& x \in R)\} \\
&= (T \triangle S) \triangle R \\
&= (S \triangle T) \triangle R \\
&= R \triangle (S \triangle T)
\end{aligned}$$

3. $R \cap (S \triangle T) = (R \cap S) \triangle (R \cap T)$

For $R \cap (S \triangle T)$, we have:

$$\begin{aligned}
R \cap (S \triangle T) &= \{x | x \in R \& (x \in S \& x \notin T \vee x \in T \& x \notin S)\} \\
&= \{x | x \in R \& x \in S \& x \notin T \vee x \in R \& x \in T \& x \notin S\}
\end{aligned}$$

For $(R \cap S) \triangle (R \cap T)$, we have:

$$\begin{aligned}
(R \cap S) \triangle (R \cap T) &= \{(x \in R \& x \in S) \& (\neg(x \in R \& x \in T)) \\
&\quad \vee (x \in R \& x \in T) \& (\neg(x \in R \& x \in S))\} \\
&= \{x | x \in R \& x \in S \& (x \notin R \vee x \notin T) \\
&\quad \vee x \in R \& x \in T \& (x \notin R \vee x \notin S)\} \\
&= \{x | x \in R \& x \in S \& x \notin T \vee x \in R \& x \in T \& x \notin S\}
\end{aligned}$$

So we can assert that $R \cap (S \triangle T) = (R \cap S) \triangle (R \cap T)$.

Now we will prove that set $\mathcal{M}(A)$ with operations symmetric difference and intersection is a ring.

1. $(\mathcal{M}(A), \Delta)$ is Abelian group.

(a) Associativity:

$$\because \forall R, S, T \in \mathcal{M}(A), (R \Delta S) \Delta T = R \Delta (S \Delta T)$$

(b) Commutativity:

$$\because \forall R, S \in \mathcal{M}(A), R \Delta S = S \Delta R$$

(c) Closure:

$$\forall R, S \in \mathcal{M}(A) \Rightarrow R \subseteq A, S \subseteq A \Rightarrow R \Delta S \subseteq A \Rightarrow R \Delta S \in \mathcal{M}(A)$$

(d) Zero element exists: Consider empty set in $\mathcal{M}(A)$

$$\forall R \in \mathcal{M}(A), R \Delta \emptyset = \emptyset \Delta R = R$$

We have proved that it is a group.

2. Satisfy the law of distribution.

From nature 3 of operation symmetric difference, we can get it.

3. Closure of operation intersection. $\forall R, S \subset A \Rightarrow R \cap S \subset A$

We have proved that $(\mathcal{M}(A), \Delta, \cap)$ is a ring.
